ExifTool is the toolset required to convert and edit EXIF (Exchangeable Image File Format) metadata. It's also a valuable tool for archiving and backup, as it is used by the majority of digital cameras. PhotoComment is a simple little tool that converts the EXIF comments in your digital camera JPEG files into meta information. PhotoComment converts the data in standard EXIF comments. To do this, it changes the different data fields so that the data is compatible with the XML dump or PD (Photo Data) format that most photo editing software accepts. The photos you take with your digital camera are generally made up of a mixture of JPEG and RAW data. Like other EXIF modifiers, PhotoComment has four major sections: Preferences - The main preferences for PhotoComment. Convert - Convert the EXIF data from the current file to an XML dump format. Add - Add new EXIF data to the current file to make it a PD file (Photo Data). Options - On/Off switches for options, related to many of the functions in PhotoComment.
